How server work

All route for the API are in **server.ts**, if you want to add new route add it here in the right section:

- 'User section' => all route related to the user request (add/alter/drop)
- 'Data section' => all route related to the data function (add/alter/drop)
- 'Account type section' => all route related to the different account type (add/alter/drop)
/!\ do not move the server

What is requeter for ?

requeter.ts is where we put all the prisma request that we call in our function / API, the are 2 sections in **requeter.ts**:

- 'admin only' => contain all admin only request (fetch all users / alter any user / account type changement)
- 'public' => all other request that can be used by any user

/!\ Do not move **requeter.ts**
