

Install SteamCMD

Requirements

- Linux Server (ubuntu 22.04 LTS)

Installation

First you need to create an user that will manage the steamcmd utilities

```
sudo useradd -m steam
sudo passwd steam
sudo usermod -a -G sudo steam
```

then go into the steam home folder

```
sudo -u steam -s
cd
```

to install the package you need to add the repository and install some dependencies

```
sudo add-apt-repository multiverse; sudo dpkg --add-architecture i386; sudo apt update
sudo apt install steamcmd
```

for the first start of the app you need to run it with the full path

```
/usr/games/steamcmd
```

after that add the path to your \$PATH

```
export PATH="$PATH:/usr/games"
```

when it's done you can run the steamcmd just by call it and you will get the steamcmd prompt

```
steamcmd
steamcmd>
```
